

A woman with blonde hair, wearing a blue Rab jacket, a purple headband with a large 'R' logo, and glasses, is sitting in a snowy mountain landscape. She is holding a small metal cup of coffee. A large, out-of-focus orange object is in the foreground. The background shows snow-covered mountains under a clear sky.

Ascendor Alpine Pants

QFU-80

Mens
EBN

Our definitive winter mountaineering pant for pushing your limits in winter alpine conditions. Using mid-weight bonded Matrix™ softshell, this pant is protective, windproof and offers impressive freedom of movement for extreme mountain terrain. A replacement for our popular Spire Pants.

FEATURES

- Semi-adjustable waistband with hook-and-loop adjustment, double snap closure and YKK® 2-way zip fly
- High waistband for good fit and comfort when wearing a harness
- Belt loops and detachable braces give multiple options for support
- 2 YKK® zipped, mesh-lined hand pockets. 1 YKK® zipped rear pocket
- 2 YKK® concealed low profile thigh venting zips
- Long length gusset at crotch and knee articulation for ease of movement
- Reinforced kicker patches and hems for durability
- Zipped ankle gusset to widen hem for differing sizes and types of mountain footwear. Elasticated internal snow gaiter at hem

Our commitment to phase out PFAS.

We believe that selling a product as 'PFAS-Free' should apply to the full product, not just its DWR.

What are PFAS?

Per- and polyfluoroalkyl substances (PFAS) are used to make products waterproof.

Adding PFAS to a fabric means water beads on its surface and rolls off, rather than being absorbed. Forming a basis for membranes and weather-proof treatments such as durable water repellent (DWR) coatings in outdoor clothing, shoes, tents and backpacks as well as a multitude of other consumer products.

They can take up to 1,000 years to degrade.

What are they?

There's increasing research that shows PFAS leach from materials and find their way into the water supply.

Outdoor clothing isn't the only source of exposure but we recognise we must take responsibility to initiate change. Even more so because we see the effects on the natural world first-hand and want to do what we can to protect it.

They have been associated with health problems in both wildlife and people, and are known to be persistent, bio-accumulative and toxic.

What are we doing?

We set ourselves targets to find alternative solutions that provide an equal amount of protection without compromising technical performance.

We've eliminated the most harmful longer-chain PFAS chemicals (C8) and looked for other ways of maintaining water repellency, breathability, and durability from smaller-chain PFAS (C6) that are less harmful to the environment. The remaining styles to use these smaller-chain PFAS are those that demand the highest standards in performance and durability, and where alternative options evaluated have yet to meet the performance criteria.

We're working with our ingredients partners to eliminate all intentional use of PFAS from our ranges by AW25. Not just from fabrics, but zips and trims too.

What does that mean for our garments?

Garments with a PFAS-free DWR coating may appear to 'wet out' quicker and not always demonstrate the iconic 'beading' that we have come to expect. Over time the DWR coating may deteriorate, causing the garment to soak up moisture, affecting its weight and breathability. Sweat, dirt, and residue from cosmetics and lotions can also become impregnated into the fabric.

Washing waterproof garments regularly is key to performance and longevity.

1. GENERAL

1.1	What is the difference between fluorocarbons / PFCs / PFAS etc?	<p>A fluorocarbon is a manmade compound formed by a bond between fluorine and carbon. There are many different types, hence the proliferation of various—and often confusing—acronyms such as PFC, PFAS and PFCec, used by the textile industry to define and categorise the harmful ones. Recently, the business and scientific community have agreed upon PFAS as the collective name for relevant fluorocarbons.</p> <p>PFC: Perfluorinated compounds (or carbons, or chemicals)</p> <p>PFAS: Per and poly-fluoroalkyl substances</p> <p>PFCec (GORE-TEX's definition): Perfluorinated compounds of environmental concern</p>
1.2	Why are PFAS used?	<p>PFAS are a category of synthetic chemical that are used to make products waterproof. The characteristics of PFAS means they're the perfect addition to outdoor products. Adding PFAS to a fabric means water beads on its surface and rolls off, rather than being absorbed. Forming a basis for membranes and weather-proof treatments such as durable water repellent (DWR) coatings in outdoor clothing, shoes, tents and backpacks as well as a multitude of other consumer products.</p>
1.3	Where are PFAS found?	<p>PFAS are widely used to make everyday products resistant to stains, grease and water. For example, they may be used to keep food from sticking to cookware, to make sofas and carpets resistant to stains, to make clothes water resistant, used in some food packaging and in some firefighting materials.</p>

2. TERMINOLOGY

2.1	What does PFAS-free mean?	<p>PFAS-free means we've phased out all intentionally added PFAS and we are compliant with current EU and US legislation.</p>
2.2	Why do we say phase out instead of eradicate?	<p>PFAS do not occur in the natural environment and can't be degraded promptly by water, light or bacteria. Often referred to as 'Forever Chemicals', these synthetics can take as long as 1,000 years to degrade. Due to their properties it's extremely difficult to 'eradicate' them, but we can phase them out of use in our supply chain.</p>
2.3	What do we mean by intentional vs unintentional use of PFAS?	<p>It may be possible for cross-contamination to occur within a complex supply chain, in retail outlets or in the general day-to-day use of an item. As a result, unintentional trace PFAS could still be found on products.</p>

3. PFAS USE

3.1	When did Rab first start using PFAS?	<p>Over 40 years ago, British mountaineer Rab Carrington started making sleeping bags with performance fabrics using DWR treatments that contained PFAS. These were to be used in the most extreme and hostile environments on the planet, and PFAS provided unparalleled performance for such conditions at the time.</p>
3.2	Why does Rab still use PFAS?	<p>At Rab, product performance is at the core of everything we do. We are a highly technical brand, providing products for some of the most extreme environments in the world. We will never compromise on that. We replace fabrics and materials with PFAS-free alternatives wherever available and possible if performance is not sacrificed.</p>
3.3	Which products still contain PFAS?	<p>For AW23, 95% of Rab's products with a DWR have now transitioned to PFAS-free DWR treatments. The remaining styles are those that demand the highest standards in performance and durability, and where alternative options have yet to meet stringent performance criteria. All our Rab Hydrophobic Down insulation is PFAS-free which we developed in conjunction with Nikwax®.</p> <p>You can find if/where PFAS are still present in a product by viewing its corresponding Material Facts table.</p>
3.4	When is Rab's deadline?	<p>We are working hard with our ingredients partners and continuing to phase out all intentional use of PFAS from our ranges by AW25.</p>
3.5	What about Lowe Alpine?	<p>All fabric bought for Lowe Alpine packs has been 100% PFAS-free since 2019.</p>

4. PRODUCT CARE

4.1	<p>Are there any obvious differences in PFAS-free performance for garments?</p>	<p>Garments with a PFAS-free DWR coating may appear to 'wet out' quicker and not always demonstrate the iconic 'beading' that we have come to expect. Over time the DWR coating may deteriorate, causing the garment to soak up moisture, affecting its weight and breathability. Sweat, dirt, and residue from cosmetics and lotions can also become impregnated into the fabric.</p>
4.2	<p>Are PFAS-free products harder to care for?</p>	<p>As we move to newer less harmful alternatives, the way that we care for these garments is changing. Expectations will need to shift as more care is required to maintain water repellency and breathability. To ensure optimal performance, we encourage our consumers to regularly maintain, wash, and re-proof their waterproof products, particularly as these are updated to PFAS-free DWR alternatives.</p>
4.3	<p>How often should you wash and reproof a PFAS-free garment?</p>	<p>Washing waterproof garments is key to performance and longevity. Wash more frequently (every 1-3 months), use a cleaner that is designed for waterproof shells, and avoid fabric softeners, which coat the fabric and make it less water-repellent. Tumble dry (or iron under a cloth) to finish, as heat is an essential part of reactivating the water-repellent properties.</p> <p>If a garment starts to soak up moisture, or 'wetting out', it's time for re-proofing. Incorporate a PFAS-free re-proofing solution when performing the above steps.</p> <p>Suitable product care can be performed at home, but the Rab Service Centre also provides professional wash and reproofing services.</p>

We must be clear about how we communicate CSR information relating to our brands and products. This ensures a consistent message and that we comply with the latest guidance and legislation. Be specific. Be clear. Be accurate.

MATERIAL FACTS PRODUCT CLAIMS

When referring to product sustainability data always refer to current Material Facts tables.

Avoid these words: "eco", "eco-friendly", "green", "environmentally friendly", "ethical", "sustainable".

FAIR WEAR FOUNDATION

When speaking about Fair Wear:

We are a "member of Fair Wear Foundation" and are committed to improving working conditions for garment workers.

Use the full "Fair Wear Foundation" name on the first mention, and then shorten to "Fair Wear".

Use the 'Rab and Lowe Alpine are members of' logo when discussing products or our membership.

Don't describe the product as "fair", "ethical", or "responsibly made". It is not Fair Trade.

Fair Wear do not certify, audit, or approve us. Avoid these terms.

Recommended wording: "Rab and Lowe Alpine awarded "Leader" status by Fair Wear for the second year running in 2023."

RESPONSIBLE DOWN STANDARD

When writing about Responsible Down Standard use the full name in the first mention, then the abbreviation RDS. When making a product RDS claim, you must:

State "This product / component is RDS certified by Control Union 839597."

Include the RDS logo with the licence number.

Any mention of species or quality must be made in its own sentence in isolation, and not refer to RDS e.g. "This jacket uses 800FP goose down."

Link to <https://textileexchange.org/standards/responsible-down/>

Describe RDS as "The [Responsible Down Standard / RDS] independently certifies down against animal welfare requirements and tracks it from the source to the final product."

Never describe RDS certified down as "ethical", "kind" or "animal friendly".

CLIMATE ACTION / RACE TO ZERO

We no longer describe Equip, Rab or Lowe Alpine as a "Climate Neutral Company". We are phasing out this older language and removing our South Pole Climate Neutral label for SS25.

When describing our efforts we are no longer "aiming for Net Zero emissions by 2030".

Instead, we have committed to Science Based Targets (SBT) with near-term and long-term targets.

"Equip / Rab / Lowe Alpine commits to reduce absolute scope 1 and scope 2 GHG emissions 46% by 2030 from a 2019 base year, and to measure and reduce its scope 3 emissions."

"Equip / Rab / Lowe Alpine commits to reduce absolute scope 1, 2, and 3 GHG emissions 90% by 2050 from a 2019 base year."

For any queries, questions, concerns, amends or confusion please contact:

1. FABRIC AND MATERIAL DATA

1.1	Why does Rab still use fluorocarbons (PFAS)?	We have removed all long-chain (C8) fluorocarbons (PFCs) from our supply chain. However, some short-chain (C6) fluorocarbons (PFCs) are still needed for some of our high-end technical products. We are working with our partners to eliminate fluorocarbons from all our ranges by AW24.
1.2	How do all these changes to fabrics and materials affect the durability and longevity of your products?	At Rab, product performance is at the core of everything we do. We are a highly technical brand, providing products for some of the most extreme environments in the world. We will never compromise on that. We replace fabrics and materials with recycled and fluorocarbon-free alternatives wherever available and possible if performance is not sacrificed. Through our Rab Lab programme, we are educating end consumers on how to treat their outdoor kit to maximise its performance and longevity.
1.3	What's a trim?	A trim is an item added to apparel or equipment which enhances it, adds technical features, or increases brand presence. Trims include (but are not limited to) zips, toggles, pulls, pocket linings, logos, hood stiffeners, cords, and eyelets.
1.4	Which weights of garments are you using?	Men's: Calculations based upon the weight of a men's size medium. Women's: Calculations based upon the weight of a women's size 10. Unisex Apparel: Calculations based upon the weight of a size medium. Sleeping Bags: Calculations based on the weight of a regular-length sleeping bag. Sleeping Bag Liners/Accessories: Based on actual product weight
1.5	Why does the Material Facts table show 1% recycled trims and yet the overall product content is showing 0% recycled?	Our data is accurate. Rounding rules mean that we would have to show % to a number of decimal places. For simplicity we have rounded up, hence sometimes a small percentage of recycled content in a trim will not show against the overall garment's % recycled materials.
1.6	Why is there sometimes variation in women's and men's recycled content?	Size and cut variations between men's and women's designs may result in the trims (i.e. zips, toggles, pullers) being a greater or lesser % of the overall product weight. This could reflect in small percentage changes in recycled content.
1.7	Why do zips and trims contain fluorocarbons?	Fluorocarbons are commonly used in the manufacturing process for many moulded items such as toggles and zips, as a release agent from moulds. Some zips have PTFE, a legally compliant fluorocarbon, in the enamel paint used on sliders and some pin boxes. Trace fluorocarbons may remain on the trim. Shell jackets include trims such as seam tapes and pocket liners that may contain ePTFE membranes. Threads sometimes use fluorocarbons as lubricants, but ours don't.
1.8	What aren't you measuring?	We've tried to be as accurate and broad as possible, capturing as much data as we can, all the way down to the zip puller and care label. However there are some elements that we do not have weights for, so can't yet include: glue and adhesives (excluding seam tapes), threads – used to stitch the final product together, embroidery, heat transfers and screen prints and box wall mesh. Packaging is out of scope.

2. MATERIAL FACTS GENERAL P1

2.1	Will you keep Material Facts exclusively to yourselves?	Material Facts is NOT a branded programme. We are sharing our knowledge with industry groups and partners. Material Facts will support retailers when talking to their customers about sustainability credentials.
2.2	Are you the first brand in the outdoor industry to take such an approach?	We have seen this approach in other industries, e.g. food industry. To our knowledge, this kind of granular information has not been shared with end consumers by the outdoor industry so far.
2.3	Do you see any negative effects in sales by taking an honest and open approach to sustainability claims?	We have seen strong support for our transparent and open approach to accurate sustainability data.
2.4	Are there any products or ranges you are particularly focusing on?	We began by applying Material Facts to insulation, committing to deliver the tables by the AW23 consumer launch. The teams have worked hard across all ranges, and we are delighted to share that all apparel up to and including SS24 will be covered by the Material Facts data tables by this launch date. Equipment and accessories will come online within the coming seasons.

2. MATERIAL FACTS GENERAL P2

2.5	How is Material Facts different from other approaches to sustainability communications?	Material Facts is about integrity and passion for data and detail. We cannot underplay the complexity that sustainability data is characterised by. It means different things to each individual. We want to provide information that allows the end consumer to take their own educated decision.
2.6	Does Material Facts also include packaging credentials?	For now, Material Facts is only focusing on the product. We have included some storage elements where relevant i.e. stuff sacks on apparel items.
2.7	Is Lowe Alpine also covered by Material Facts?	For now, Material Facts only covers our apparel ranges. Equipment and accessories will come online within the coming seasons.
2.8	Are stuff sacks and storage bags included?	We have included Material Facts data for stuff sacks on apparel items. These are included within the fabric/trims of the tables. For sleeping bags, these will be included at a later date, alongside storage sacks.
2.9	Why have you not included stuff sacks for sleeping bags?	Sleeping bags have both stuff sacks and storage bags. For now, we have concentrated on the product (the sleeping bag) Material Facts table. We are exploring the best way to share the Material Facts data for storage and stuff sacks for a future release.
2.10	How accurate is the Material Facts data table?	The Material Facts data has been calculated by component, by item and by weight. Each table has been manually checked by product and material experts and cross-checked with fabric and factory certificates. We have taken all reasonable steps to ensure accuracy. However it is possible that inadvertent errors and tolerances in data may occur.

3.0 FLUOROCARBONS

3.1	Why does Rab still use fluorocarbons (PFAS/PFCs)?	We have removed all long-chain (C9) fluorocarbons from our supply chain. However, some short-chain fluorocarbons (C6) are still needed for some of our high-end technical products. We are working with our partners to eliminate fluorocarbons from all our ranges by AW24.
3.2	Why do zips and trims contain fluorocarbons (PFAS/PFCs)?	<p>Fluorocarbons are commonly used in the manufacturing process for many moulded items such as toggles and zips, as a release agent from moulds. Trace fluorocarbons may remain on the trim.</p> <p>Shell jackets include trims such as seam tapes and pocket liners that may contain ePTFE membranes.</p> <p>Threads sometimes use fluorocarbons as lubricants, but ours don't.</p> <p>Waterproof zips may also use DWR treatments that contain fluorocarbons, but we're working with our zips supplier to phase these out.</p> <p>Fluorocarbons can also be found in zip sliders.</p>
3.3	Why do some of your zips contain fluorocarbons?	<p>Although they might seem simple, zips are made of multiple components:</p> <p>Teeth – the interlinking elements that form a chain.</p> <p>Tape – the fabric used to stitch the teeth into the product.</p> <p>Slider – the part that moves up and down to open/close the chain.</p> <p>Stopper – the components that stop the slider at the top and bottom.</p> <p>Pin box – the box at the bottom of separating zips that aligns the two zipper halves to close.</p> <p>Puller – the extra loop of cord that is added to make pulling the slider easier.</p> <p>Ahead of launching Material Facts, our zip supplier informed us that, apart from some waterproof zips that use a DWR, all the zip components were fluorocarbon-free. In July 2023, as a result of additional due diligence and testing, they notified us that they had discovered fluorocarbons (specifically PTFE a legally compliant fluorocarbon) in the enamel paint they use on sliders and some pin boxes. As a global zip manufacturer, this paint can be found in zips used across multiple industries and by numerous apparel brands. We are working with our supplier to address the issue and expect to be able to switch completely to fluorocarbon-free variants by winter 2024.</p> <p>The contents account for the small amounts of enamel paint used on the metal slider and pin box. The zipper teeth, tape, stoppers, and pullers do not use enamel paint. The chance of PTFE being released during use is low as enamel paint is designed to be stable and resistant to penetration.</p> <p>In August 2023 we updated and reissued the Material Facts data tables for all products to account for the PTFE found in these components. As these are phased out each Material Facts table will be updated accordingly.</p>
3.4	Can fluorocarbons be introduced 'accidentally'?	Fluorocarbons are found in a variety of household and commercial products. They are (or have been) commonly used in ski/surf wax, chain lubricants, sewing machine lubricants, spray-on stain repellents, firefighting foam and fast-food grease repellent wrappers. It may be possible for cross-contamination to occur within a complex supply chain, in retail outlets or in the general day-to-day use of an item. As a result, unintentional trace fluorocarbons could be found on products.

4. OTHER

4.1	This product also says it contains synthetic insulation, but I can't see it listed.	We may use synthetic insulation in cuffs, over the shoulder or in the neck baffle of a mostly down insulated product. The data for these synthetic elements is captured under "trims".
4.2	How is the Total Recycled Content calculated?	The Material Facts totals are calculated by taking the weight and recycled content of each individual component, and calculating that as a percentage of the overall weight. A heavier component will have a greater impact on the total recycled content. The percentage of recycled content of each component is verified using GRS certification or equivalent.
4.3	Why have you only calculated Materials Facts for size 10/M/Regular?	We have used an average size to keep the data tables simple and as these are the sample sizes used throughout our business.
4.4	Why does the country of manufacture on the table differ from the care label?	There are occasions where the manufacturing country may change at short notice. While we will always try to maintain this information, products from previous seasons may still be in the supply chain. The care label is always accurate.
