

The Rab logo, featuring a stylized white bird icon followed by the word "Rab" in a white serif font, with a registered trademark symbol (®) to the upper right.

Rab®

A full-page background image of a skier in a white and black outfit descending a steep, snow-covered mountain slope. The skier is leaving a trail of snow behind them. In the background, a large, rugged mountain peak with patches of snow and dark rock faces rises against a clear blue sky. The overall scene is a high-altitude winter landscape.

When warmth and comfort are critical, this thick, rugged down air mat ensures a sound night's sleep in the world's coldest environments. With 650FP duck down and durable 75D fabric, it's equipped for high altitudes and expedition use.

FEATURES

- R-Value: 9.5
- Thickness: 10cm for added comfort
- Oversized outer chambers help keep you centralised on the mat
- Lightweight construction uses air and insulation for superb warmth-to-weight ratio and minimal pack-size
- Hybrid rectangular shape allows various comfortable sleeping positions
- Low profile two-way valve for easy inflation and deflation
- Pump sack included for rapid and hygienic inflation
- Roll-away stuff sack with repair kit included

Unisex
MAM

Incredibly warm yet light and packable down air mat for ultralight missions in hostile landscapes, from winter alpine climbing to Arctic ultra running. Powered by 800FP down and ultralight 20D fabric, it offers exceptional warmth for its weight.

FEATURES

- R-Value: 7.3
- Thickness: 8cm
- Oversized outer chambers help keep you centralised on the mat
- Lightweight construction uses air and insulation for superb warmth-to-weight ratio and minimal pack-size
- Hybrid rectangular shape allows various comfortable sleeping positions
- Low profile two-way valve for easy inflation and deflation
- Pump sack included for rapid and hygienic inflation
- Roll-away stuff sack with repair kit included

Unisex
DPW

Combining TILT and a new weight-saving and heat-trapping construction, this featherlight air mat offers superb warmth for weight and packability. Highly comfortable, it's the ideal foundation for thru-hiking and multi-day mountain runs.

FEATURES

- 2 layers of TILT reflective film help reduce radiant heat loss without adding weight or bulk
- 20D recycled polyester outer
- Offset weight-saving internal cut outs to keep warm air static
- R-Value: 4.9
- Thickness: 8cm
- Packed size: 18x9cm
- Tapered mummy shape to save weight
- Low-profile two-way valve for easy inflation and deflation
- Pump sack included for rapid and hygienic inflation
- Roll-away stuff sack with repair kit included

Unisex
DPW

Combining ultralight fabric and a new construction that's lighter than ever, this air mat offers maximum packability for when every gram counts. Highly comfortable, it's the ideal foundation for summer thru-hiking and multi-day mountain runs.

FEATURES

- 20D recycled polyester outer
- Offset weight-saving internal cut outs to keep warm air static
- R-Value: 1.4
- Thickness: 8cm
- Packed size: 18x9cm
- Tapered mummy shape to save weight

CSR
Communications guidance

Autumn Winter 2026

We must be clear about how we communicate CSR information relating to our brands and products. This ensures a consistent message and that we comply with the latest guidance and legislation. Be specific. Be clear. Be accurate.

Material Facts Product Claims

When referring to product sustainability data always refer to current Material Facts tables.

Avoid these words: “eco”, “eco-friendly”, “green”, “environmentally friendly”, “ethical”, “sustainable”.

Fair Wear Foundation

When speaking about Fair Wear:

We are a “member of Fair Wear Foundation” and are committed to improving working conditions for garment workers.

Use the full “Fair Wear Foundation” name on the first mention, and then shorten to “Fair Wear”.

Use the ‘Rab and Lowe Alpine are members of’ logo when discussing products or our membership.

Don’t describe the product as “fair”, “ethical”, or “responsibly made”. It is not Fair Trade.

Fair Wear do not certify, audit, or approve us. Avoid these terms.

Recommended wording: “Rab and Lowe Alpine awarded “Leader” status by Fair Wear for the second year running in 2023.”

PFAS

Working with our ingredients partners, we have phased out all intentional use of PFAS from our ranges for the AW25 season and beyond. We are compliant with current EU and US legislation (excluding extreme use products i.e expedition suits).

Washing and caring for waterproof garments regularly is the key to performance and longevity.

Consumers can use the Rab Service Centre for professional aftercare services or find educational resources on Rab Lab to perform aftercare at home.

Responsible Down Standard

When writing about Responsible Down Standard use the full name in the first mention, then the abbreviation RDS. When making a product RDS claim, you must:

State “This product / component is RDS certified by Control Union 839597.”

Include the RDS logo with the licence number.

Any mention of species or quality must be made in its own sentence in isolation, and not refer to RDS e.g. “This jacket uses 800FP goose down.”

Link to <https://textileexchange.org/standards/responsible-down/>

Describe RDS as “The [Responsible Down Standard / RDS] independently certifies down against animal welfare requirements and tracks it from the source to the final product.”

Never describe RDS certified down as “ethical”, “kind” or “animal friendly”.

Climate Action / Race To Zero

We no longer describe Equip, Rab or Lowe Alpine as a “Climate Neutral Company”. We are phasing out this older language and removed our South Pole Climate Neutral label in SS25.

When describing our efforts we are no longer “aiming for Net Zero emissions by 2030”.

Instead, we have committed to Science Based Targets (SBT) with near-term and long-term targets.

“Equip / Rab / Lowe Alpine commits to reduce absolute scope 1 and scope 2 GHG emissions 46% by 2030 from a 2019 base year, and to measure and reduce its scope 3 emissions.”

“Equip / Rab / Lowe Alpine commits to reduce absolute scope 1, 2, and 3 GHG emissions 90% by 2050 from a 2019 base year.”

For any queries, questions, concerns, amends or confusion please contact:

Corporate Communications Coordinator

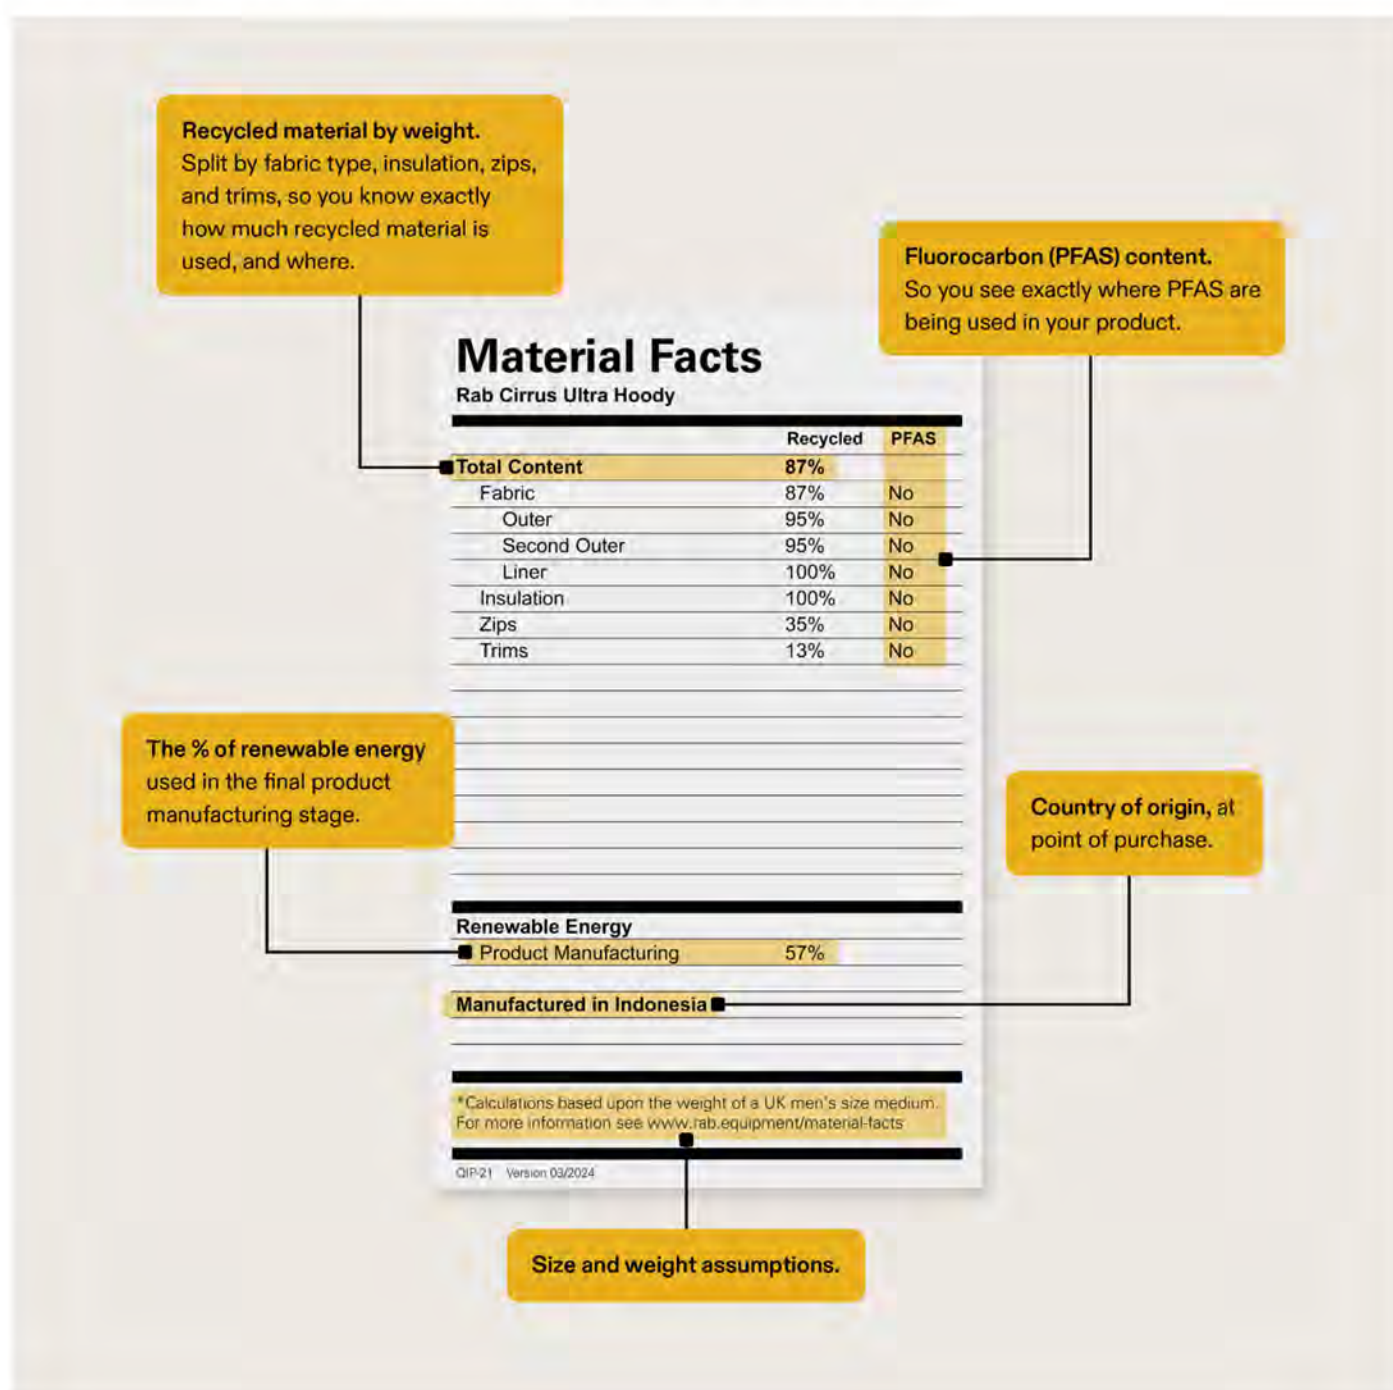

The Material Facts Table

The outdoor industry has long been passionate about reducing our impact and preserving our mountain playground. But we recognise that sustainability claims about our products can be confusing.

That's why we created Material Facts. These simple, black-and-white tables give you the raw data about our products, so you can make informed choices when buying your gear.

Clear. Concise. Honest.

You can find Material Facts tables for all our current products on the product pages of our website.

The Material Facts Collective

Why is a sustainability data-sharing standard important?

Brands are being asked by retailers and consumers and are being driven by legislation to provide accurate data on sustainability criteria. Data must be clear, honest, transparent and standardised and be mindful of the complexity of technical product composition.

Who are the Material Facts Collective?

The Material Facts Collective is a group of like-minded technical outdoor hard goods and apparel brands determined to standardize an industry data methodology.

We are technical experts, driven by performance and accuracy and are frustrated with the inefficiencies of individual data collection tools and ambiguity around sustainability criteria

What are we trying to achieve?

Aligning with the EOG SDEX platform, we can provide the data alignment that retailers need, reduce duplicate efforts across our brands, and begin to future proof our businesses ready for the ESG data requirements which are on the horizon.

Removing the complexity and standardizing sustainability data is the only way forward. We may not have it right (yet) but as a group of brands we are committing to be transparent, show our methodology and align our approach.

The working group have been collaborating on three outputs for the industry:

- Revise the Material Facts methodology to provide a robust, scalable solution that works for new categories, and new data criteria
- Develop a toolkit to support brands in adopting the methodology
- Create a roadmap for adding new criteria to Material Facts tables

Why is a sustainability data-sharing standard important for retailers?

Retailers are often the spokespeople for brand messaging. They are looking for efficient ways to obtain accurate product sustainability data. Legislation, such as the Green Claims Directive, is making the collection, understanding and communication of this data more challenging.

This initiative is designed to support you in complying with legislation that requires accurate green claims. We are proud to lead the way in providing precise and reliable product sustainability data, ensuring that our partners can confidently meet regulatory requirements.

We are open to discussing how we can further cooperate to enhance our mutual efforts in sustainability.

What are the timelines?

The first phase of the Material Facts Collective will conclude in Spring 2025, all outputs and resources will be available to download on the European Outdoor Group website.

The full implementation toolkit will include:

Methodology document: Detailing the steps, calculations, and assumptions

Calculations template: Allowing brands to check calculations as they engage with the methodology

Communications guidelines: Defining how brands will communicate Material Facts data

Business case: Securing internal buy-in and resource.

The Collective working group will meet later in 2025 and review how the methodology can be further improved based on brands' feedback and adoption.

Material Facts FAQs

The FAQs have changed, see this doc for info

1. Fabric and material data

1.1	How do all these changes to fabrics and materials affect the durability and longevity of your products?	At Rab, product performance is at the core of everything we do. We are a highly technical brand, providing products for some of the most extreme environments in the world. We will never compromise on that. We replace fabrics and materials with lower impact alternatives wherever available and possible if performance is not sacrificed. Through our Rab Lab programme, we are educating end consumers on how to treat their outdoor kit to maximise its performance and longevity.
1.2	What's a trim?	A trim is an item added to apparel or equipment which enhances it, adds technical features, or increases brand presence. Trims include (but are not limited to) zips, toggles, pulls, pocket linings, logos, hood stiffeners, cords, and eyelets.
1.3	Which weights of garments are you using?	Men's: Calculations based upon the weight of a men's size medium. Women's: Calculations based upon the weight of a women's size 10. Unisex Apparel: Calculations based upon the weight of a size medium. Sleeping Bags: Calculations based on the weight of a regular-length sleeping bag. Sleeping Bag Liners/Accessories: Based on actual product weight.
1.4	Why does the Material Facts table show 1% recycled trims and yet the overall product content is showing 0% recycled?	Our data is accurate. Rounding rules mean that we would have to show % to a number of decimal places. For simplicity we have rounded up, hence sometimes a small percentage of recycled content in a trim will not show against the overall garment's % recycled materials.
1.5	Why is there sometimes variation in women's and men's recycled content?	Size and cut variations between men's and women's designs may result in the trims (i.e. zips, toggles, pullers) being a greater or lesser % of the overall product weight. This could reflect in small percentage changes in recycled content.
1.6	What aren't you measuring?	We've tried to be as accurate and broad as possible, capturing as much data as we can, all the way down to the zip puller and care label. However there are some elements that we do not have weights for, so can't yet include: glue and adhesives (excluding seam tapes), threads – used to stitch the final product together, embroidery, heat transfers and screen prints and box wall mesh. Packaging is out of scope.
1.7	How can you be sure your data is accurate?	We work with our manufacturing and ingredient partners to increase transparency and improve the sustainability credentials of our products. We rely on them to share information in a timely and accurate manner to ensure that our data claims can be validated.

2. Material Facts general

2.1	Will you keep Material Facts exclusively to yourselves?	Material Facts is NOT a branded programme. We are sharing our knowledge with industry groups and partners. Material Facts will support retailers when talking to their customers about sustainability credentials.
2.2	How is Material Facts different from other approaches to sustainability communications?	Material Facts is about integrity and passion for data and detail. We cannot underplay the complexity that sustainability data is characterised by. It means different things to each individual. We want to provide information that allows the end consumer to take their own educated decision.
2.3	Does Material Facts also include packaging credentials?	For now, Material Facts is only focusing on the product. We have included some storage elements where relevant i.e. stuff sacks on apparel items.
2.4	Is Lowe Alpine also covered by Material Facts?	As of AW24 Lowe Alpine packs are now also covered by Material Facts after our expansion to equipment and packs.

2.5	How accurate is the Material Facts data table?	The Material Facts data has been calculated by component, by item and by weight. Each table has been manually checked by product and material experts and cross-checked with fabric and factory certificates. We have taken all reasonable steps to ensure accuracy. However it is possible that inadvertent errors and tolerances in data may occur.
-----	--	---

3. Material Facts Collective

3.1	What is the Material Facts Collective?	The collective, launched in September 2024, is a collaborative group of like-minded technical outdoor apparel and hard goods brands determined to standardise an industry data methodology.
3.2	What are the aims of the Material Facts Collective?	The working group have been collaborating on three outputs for the industry: Revise the Material Facts methodology to provide a robust, scalable solution that works for new categories, and new data criteria Develop a toolkit to support brands in adopting the methodology Create a roadmap for adding new criteria to Material Facts tables
3.3	When will the toolkit be available?	The first phase of the Material Facts Collective will conclude in Spring 2025, all outputs and resources will be available to download on the European Outdoor Group website.
3.4	Will the Material Facts Collective continue?	The Collective working group will meet later in 2025 and review how the methodology can be further improved based on brands' feedback and adoption. Interested parties who want to join the second phase, or who wish to receive more information on the methodology and the toolkit should reach out to the European Outdoor Group.

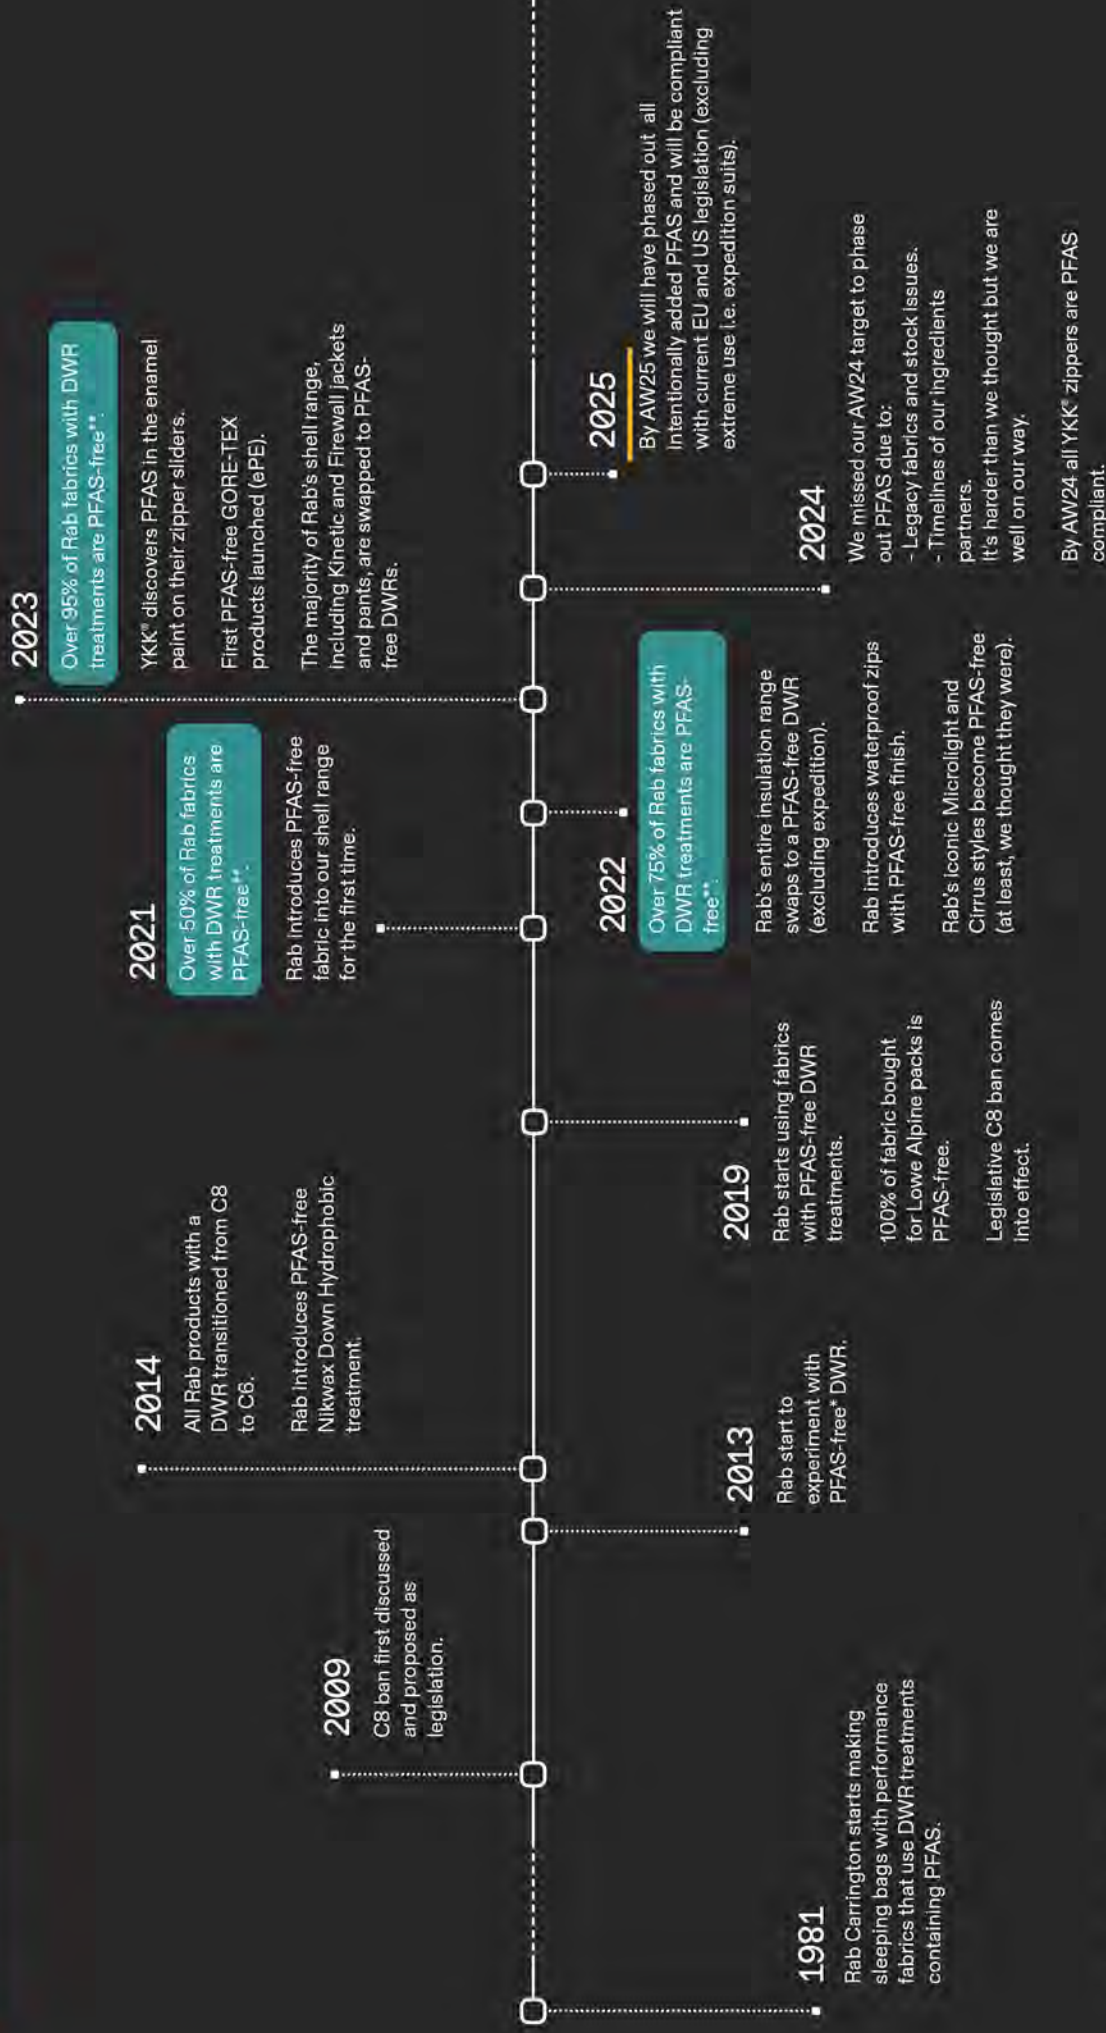

4. Renewable energy

4.1	How do you calculate renewable energy for Material Facts?	'Renewable energy' is calculated as a percentage of all energy used at the manufacturing site (including minor use of gas, fuel generators), not only electricity. The reporting period is a calendar year. We calculate the renewable energy percentage when we start sourcing from a factory and recalculate when: The production moves factory The supplier reports a significant change (i.e. installing solar panels) - in these circumstances, the reporting period is the 12 months preceding the next season launch The annual carbon accounting data collection shows a +/- 10% change It's been three years since the last calculation
4.2	What do you class as renewable energy?	Renewable energy is energy generated from a source that is not depleted when used, such as solar, wind, or hydro. Due to the complexity of different feedstocks, we do not currently include biomass in our renewable energy definition. We allow for both on-site generated and purchased renewable energy. For generated energy, we require evidence of installation and a signed testimony from the supplier. For purchased energy, we require Renewable Energy Certificates (RECs) annually and set restrictions on REC origins and issue dates.
4.3	Why aren't you reporting renewable energy in the fabric supply chain?	Currently, we only report renewable energy used by tier one suppliers (the final product manufacturing stage). This is where we have the highest leverage to influence change in an especially complex supply chain. This is just the start. Our work with the EOG's carbon reduction project should enable us to dive deeper, but we're moving in the right direction.

5. Other

5.1	This product also says it contains synthetic insulation, but I can't see it listed.	We may use synthetic insulation in cuffs, over the shoulder or in the neck baffle of a mostly down insulated product. The data for these synthetic elements is captured under 'trims'.
5.2	How is the Total Recycled Content calculated?	The Material Facts totals are calculated by taking the weight and recycled content of each individual component, and calculating that as a percentage of the overall weight. A heavier component will have a greater impact on the total recycled content. The percentage of recycled content of each component is verified using GRS certification or equivalent.
5.3	Why have you only calculated Materials Facts for size 10/M/Regular?	We have used an average size to keep the data tables simple and as these are the sample sizes used throughout our business.
5.4	Why does the country of manufacture on the table differ from the care label?	There are occasions where the manufacturing country may change at short notice. While we will always try to maintain this information, products from previous seasons may still be in the supply chain. The care label is always accurate.

Our journey to phase out PFAS.

*PFAS-FREE MEANS WE'VE PHASED OUT ALL INTENTIONALLY ADDED PFAS AND WE ARE COMPLIANT WITH CURRENT EU AND US LEGISLATION.

**BY ANNUAL LINEAR VOLUME. EXCLUDES SEAM TAPES AND LEATHER.

PFAS FAQs

1. General

1.1	What is the difference between fluorocarbons / PFCs / PFAS etc?	A fluorocarbon is a manmade compound formed by a bond between fluorine and carbon. There are many different types, hence the proliferation of various—and often confusing—acronyms such as PFC, PFAS and PFCec, used by the textile industry to define and categorise the harmful ones. Recently, the business and scientific community have agreed upon PFAS as the collective name for relevant fluorocarbons. PFC: Perfluorinated compounds (or carbons, or chemicals) PFAS: Per and poly-fluoroalkyl substances PFCec (GORE-TEX's definition): Perfluorinated compounds of environmental concern
1.2	Why are PFAS used?	PFAS are a category of synthetic chemical that are used to make products waterproof. The characteristics of PFAS means they're the perfect addition to outdoor products. Adding PFAS to a fabric means water beads on its surface and rolls off, rather than being absorbed. Forming a basis for membranes and weather-proof treatments such as durable water repellent (DWR) coatings in outdoor clothing, shoes, tents and backpacks as well as a multitude of other consumer products.
1.3	Where are PFAS found?	PFAS are widely used to make everyday products resistant to stains, grease and water. For example, they may be used to keep food from sticking to cookware, to make sofas and carpets resistant to stains, to make clothes water resistant, used in some food packaging and in some firefighting materials.

2. Terminology

2.1	What does PFAS-free mean?	PFAS-free means we've phased out all intentionally added PFAS and we are compliant with current EU and US legislation.
2.2	Why do we say phase out instead of eradicate?	PFAS do not occur in the natural environment and can't be degraded promptly by water, light or bacteria. Often referred to as 'Forever Chemicals', these synthetics can take as long as 1,000 years to degrade. Due to their properties it's extremely difficult to 'eradicate' them, but we can phase them out of use in our supply chain.
2.3	What do we mean by intentional vs unintentional use of PFAS?	It may be possible for cross-contamination to occur within a complex supply chain, in retail outlets or in the general day-to-day use of an item. As a result, unintentional trace PFAS could still be found on products.

3. Product care

3.1	Are there any obvious differences in PFAS-free performance for garments?	Garments with a PFAS-free DWR coating may appear to 'wet out' quicker and not always demonstrate the iconic 'beading' that we have come to expect. Over time the DWR coating may deteriorate, causing the garment to soak up moisture, affecting its weight and breathability. Sweat, dirt, and residue from cosmetics and lotions can also become impregnated into the fabric.
3.2	Are PFAS-free products harder to care for?	As we move to newer less harmful alternatives, the way that we care for these garments is changing. Expectations will need to shift as more care is required to maintain water repellency and breathability. To ensure optimal performance, we encourage our consumers to regularly maintain, wash, and re-proof their waterproof products, particularly as these are updated to PFAS-free DWR alternatives.
3.3	How often should you wash and reproof a PFAS-free garment?	Washing waterproof garments is key to performance and longevity. Wash more frequently (every 1-3 months), use a cleaner that is designed for waterproof shells, and avoid fabric softeners, which coat the fabric and make it less water-repellent. Tumble dry (or iron under a cloth) to finish, as heat is an essential part of reactivating the water-repellent properties. If a garment starts to soak up moisture, or 'wetting out', it's time for re-proofing. Incorporate a PFAS-free re-proofing solution when performing the above steps. Suitable product care can be performed at home, but the Rab Service Centre also provides professional wash and reproofing services.

bluesign System Partner

We are now partnering with bluesign, another step in our 5-year strategy to be marketing-leading in Environmental Social Governance (ESG) and Corporate Social Responsibility (CSR).

bluesign sets the global benchmark for responsible production with stringent criteria for chemical use, environmental performance, and resource efficiency.

It serves as a one-stop resource for navigating ESG and upcoming legislation, helping partners stay ahead of global compliance standards while embedding verified sustainability into every stage of production.

What is a bluesign System Partner?

bluesign System Partners are committed to applying the bluesign System which unites the entire textile supply chain to jointly reduce its impact on people and the environment.

All steps in the bluesign System are comprehensively monitored by independent bodies. This reduces environmental impact and ensures safe production, as well as the highest standards concerning use of resources, consumer protection, water and air emissions as well as workplace safety.

bluesign Communication Guidance

When speaking about bluesign:

- ✓ Rab and Lowe Alpine are a bluesign System Partner brand,
- ✓ Equip Outdoor Technologies are a bluesign System Partner,
- ✗ We don't currently have any bluesign Products validated, although we are exploring this for future seasons.
(A bluesign Product comprises at least 90% bluesign-certified textiles and 30% bluesign-certified accessories, i.e. minor components such as zips, buttons, etc.)
- ✗ The label bluesign System Partner and logo **must not be used in product related communication applications** such as on packaging or in product factsheets, it can only be used in reference to the company and its operations.

Packs fit data

Autumn Winter 2026

Carry systems

Aerofit™

Comfortable from the first step to the final mile, this ultralight, fully ventilated back system is built with a body-contouring mesh that runs from the back panel through to the hipbelt, providing seamless comfort and superb weight distribution through your hips and back.

PACKS: AIROX / SYCLON XP

X-SHIELD™

Built to offer complete mobility on vertical ascents, the X-SHIELD™ back system sits close to the body with a form fitting, pre curved back panel, which is also snow shedding. It has lightweight and low bulk construction with additional strap padding only where it's needed.

PACKS: LATOK / KHROMA

V-TRAX™

The V-TRAX™ carry system features a simple hook-and-loop adjustable back panel so you can easily fine-tune the length. A sturdy, comfortable harness and supportive wraparound hip belt ensure full contact with your back and hips for superb stability.

PACKS: EXION / HYPERON

Air Contour™

A lightweight, close-fitting back system with a spacer mesh and cut out air channels offering ventilation over high heat areas. With pre curved back panel and flexibility, it moves with you over all terrain.

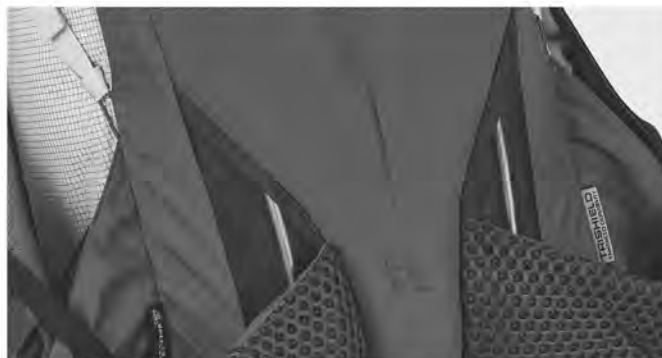

PACKS: PROTIUM / NITRON / TENSOR

TRI-FLEX™

Supportive and stable the TRI-FLEX™ carry system fits close to your back to enable complete freedom of movement and agility when carrying heavy loads. It's lightweight and strippable.

PACKS: MUON / OUTCAST / ROGUE

Carry systems

Suggested load range

Use this suggested range as a guide when loading our packs. The maximum weight that can be comfortably carried will vary according to the user's personal preference.

5 - 30 L

0 - 16 KG

30 - 50 L

7 - 19 KG

50 - 80 L

12 - 28 KG

Pack litre capacity

We use the ASTM standard F2153 Standard Test Method for Measurement of Backpack Capacity when we need to volume test our packs.

Using this standard helps us compare volumes within our range and also other manufacturers using the same standard.

The test uses 20mm plastic balls that are non-compressible and have a known volume. We then fill the pack with the balls until it's completely full in order to measure the volume. This involves filling all main body compartments and any other zipped compartments until fully packed.

The contents are then poured out into a tub with a scale on the inside. The balls are tamped down to be able to measure the height more precisely, which is then converted into the final volume of the pack.

Fabrics

ROBIC®

Fabrics and materials built with ROBIC® nylon 6 are up to 50% stronger with up to 2.5x the tear strength compared to standard nylon 6 fabrics.

Dobby

A dobby is a type of fabric that has a specific texture created by the weaving two yarns. These fabrics can have a feeling of roughness and grain next to their plain weave counterparts and also give more visual interest

Spectra®

Spectra® ripstop is an ultralight, ultra-tough grid of fibres which is woven into the fabric. These polyethylene fibres are 15 times stronger than steel for their relative weight, giving Spectra® an extremely high strength-to-weight ratio. It's also highly water- and abrasion-resistant, ideal for negotiating rugged environments and unpredictable weather.

Ballistic nylon

Created by DuPont during World War II, ballistic nylon refers to a very specific type of nylon fabric that has been engineered for improved abrasion resistance and maximum durability. A "ballistic weave" is a particularly tight and dense basket weave that maximises the fabric's tear resistance in all directions. The constructional use of large denier individual nylon threads also effectively resists continued abrasion.

Ripstop

Ripstop fabrics are constructed using stronger and sometimes thicker yarns interwoven at regular intervals in a ripstop pattern. This reinforcing technique makes them more resistant to tearing and ripping. The stronger or thicker yarns help prevent holes forming into larger tears by stopping the ripping process at the nearest reinforced cross section.

Fabric	Style	Description
210D ROBIC® Nylon with Spectra® Ripstop	Hyperon, Latok	A 210D high tenacity nylon yarn woven with 200D Spectra® ripstop, which is a high tenacity UHMWPE (ultra high molecular weight polyethylene) yarn. This makes the fabric incredibly strong while saving on weight, and it's also 92% recycled.
330D Nylon Stripe Dobby	Exion, AirZone Trail	A 210D x 420D nylon that creates the interesting weave pattern by crossing 2 different yarns. This fabric is also 50% recycled.
100D ROBIC® Nylon Ripstop	Protium, Nitron	A 100D high tenacity nylon with a contrast horizontal yarn for an eye-catching look. The high tenacity yarns and low denier create a strong but lightweight fabric that is 36% recycled.
100D Nylon with Spectra® Ripstop	Muon	A 100D nylon woven with 200D Spectra® ripstop, which is a high tenacity UHMWPE (ultra high molecular weight polyethylene) yarn. This creates an ultra-lightweight fabric with an extremely strong ripstop that is also 85% recycled.
40D ROBIC® Siliconised Nylon Ripstop	Veil XP	A 40D ultra-lightweight high tenacity ripstop nylon with a siliconised treatment applied to the face fabric providing water resistance, even before additional coatings are applied. This fabric is also 80% recycled.
100D Regen™ Ocean ROBIC® Ripstop Nylon	AirZone Ultra	A 100D high tenacity nylon ripstop which is made from recycled fishing nets. The high tenacity yarns and low denier create a strong but lightweight fabric that is 100% recycled.
1680D Ballistic Polyester	Depot	A 1680D polyester which uses the heavy weight yarns in a double basket weave to create a stiff, strong and abrasion resistant fabric that is also 50% recycled.
Mono Mesh (104gsm)	Veil, Veil XP	A ripstop made from mono-filaments which are extruded, not spun like traditional yarn. This creates a fabric that is both strong and very breathable, with low weight and water absorption.
840D Ballistic Nylon	Rogue, Outcast	An 840D nylon which uses the heavyweight yarns in a double basket weave to create a stiff, strong and abrasion resistant fabric.

Coatings

Hydroshield

Hydroshield is our standard PU coating that is applied to the reverse of our pack fabrics. As a minimum we insist that all our outer fabrics are coated with Hydroshield. It has a hydrostatic head of 1500mm meaning fabrics that use this coating could officially be classed as waterproof, however the packs themselves do not have taped seams unless stated. We also apply an additional fluorocarbon-free DWR to the face fabric.

TEAR RESISTANCE				
WATER RESISTANCE				
ABRASION RESISTANCE				

Tri-Shield®

TriShield® is our high-performance tear resistant fabric coating that can be applied to the reverse of our pack fabrics. It's made from a mixture of PU and silicone which greatly improves the tear strength of our pack materials ensuring durability.

TriShield® can either be used as a stand-alone coating with a fluorocarbon-free DWR on the face fabric or in conjunction with Hydroshield Dura for optimal tear and abrasion resistance.

TEAR RESISTANCE				
WATER RESISTANCE				
ABRASION RESISTANCE				

Hydroshield Dura

Hydroshield Dura is our premium fabric coating that works to increase both water and abrasion resistance. Here we apply a coating of either PU to both the reverse and face of the pack or TPU to the face and PU to the reverse.

TEAR RESISTANCE				
WATER RESISTANCE				
ABRASION RESISTANCE				

Sizing and fitting

ND: Narrow dimensions

You may have noticed some of our packs have the letters ND in the name.

Our Narrow Dimensions (ND) packs are built with different proportions to our regular packs, making them ideally suited to anyone with a smaller frame. They're designed to provide a comfortable and supportive fit for women or men with a narrower build.

Vest style packs

These packs are available in small, medium, and large. As they're built without a fixed back system and come in a wide range of sizes, an ND option is not required.

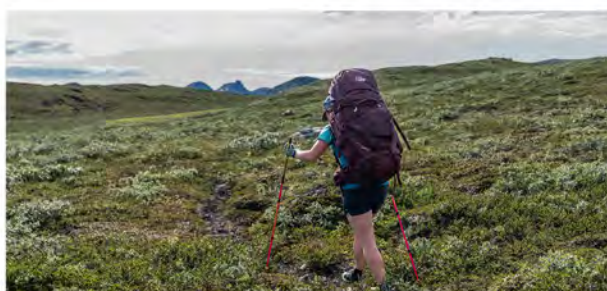

Fixed back systems

We offer an ND version for most of our packs that use a fixed back system. However, due to the smaller volume of these packs, we must reduce the pack capacity to produce a Narrow Dimensions version with the same design proportions.

50L+

When we create packs with higher volumes, we can tweak the back system without having as much of an impact on the design of the pack. This means that for packs over 50L, our ND and regular packs have the same capacity.
